

## An imagined causal network generated by 5 participants

Key: **Red nodes** = events; **Links** = expected causal links between events, **Link color** = participant who proposed the expected causal link; **Grey links** = links proposed by multiple participants; **Links with different colours at either end** = two participants propose expected causal links in opposite directions; **Node size** = number of inward links (biggest node is where outcomes of whole system will be most evident). **Software:** NetDraw.  
**Links can be filtered** by weights (e.g. ranked importance in this case), and by source (e.g. who proposed them)
